

Adobe, HTC bring Flash platform to Android

Adobe Systems and HTC have announced that the new HTC Hero is the first Android phone to ship with support for Adobe Flash Platform technology. The new phone delivers a more complete Web browsing experience and provides access to a broad variety of Flash technology-based content available on the Web today.

"As the first Android device with Flash, the new HTC Hero represents a key milestone for Android and the Flash Platform. With close to 80 per cent of all videos online delivered with Adobe Flash technology, consumers want to access rich Web content on-the-go," said David Wadhvani, vice president and general manager, Platform Business Unit at Adobe. "The collaboration with HTC offers people a more complete Flash-based Web browsing experience today and presents an important step towards full Web browsing with Flash Player 10 on mobile phones in the future."

Users can now browse and discover a broad set of Web content and applications not supported by mobile phones in the past. They can also view

YouTube videos using Flash technology, and enable full screen viewing mode by simply double-tapping the screen.

Google image search gets Creative Commons filter

Let's say you're a blogger. You've just returned from a trip to New York city, and you're writing a post on the landmarks. You want to illustrate your travel guide with an image—since, as the saying goes, a picture is worth a thousand words. It's easy to find images of New York online. But you want to make sure that you don't use images without the permission of their owners, and you can't afford licensing fees for professional photographers. Well, Google's image search can help solve your problem. Google has launched a new feature on image search to help you find images that you can

use for free, while respecting the wishes of artists and creators.

This feature allows you to restrict your search results to images that have been tagged with licences like Creative Commons, making it easier to discover images from across the Web that you can share, use and even modify. Your search will also include works that have been tagged with other licences, like GNU Free Documentation licence, or are in the public domain.

Google says, "This feature identifies images that are tagged with licences that authorise reuse. You'll still have to verify that the licensing information is accurate. We can help you take the first step towards finding these images, but we can't guarantee that the content we linked to is actually in the public domain, or available under the licence." Go to images.google.com/advanced_image_search to enable this feature.

"India yet to explore full potential of Digium and Asterisk"

Drishti Soft, a provider of communications solutions, has launched the Digium India portal. According to the company, Digium is the innovative force behind the world's most widely used open source telephony platform Asterisk. The Digium India website would provide features, synonymous with Digium, to enterprises in the Indian region. This portal hosts useful tools to facilitate faster data fetching related to Digium Cards or Switchvox equipment.

On the launch, Ankur Sharma, vice president, marketing, Drishti Soft, said, "Businesses in India are yet to explore the full potential of Digium and Asterisk. Having a dedicated portal with country specific collaboration in a market like India will help Digium strengthen its presence. This portal would not only provide Digium users with relevant information, but also serve as a platform for collaboration." Digium India is also a knowledge base for Asterisk in which application developers and solution providers can collaborate and share their ideas. Sharma further added, "The idea is to bridge the gap between authorised resellers and Digium users in the country."

Mailspect selects open source Sphinx

Mailspect Inc has selected Sphinx as the search and retrieval engine for MPP, the Message Processing Platform. Sphinx is an open source project founded and maintained by Andrew Aksyoff of Voronezh, Russia. It was designed from the ground up to integrate with SQL databases and scripting languages. "We chose Sphinx because it scaled and e-mail archives can grow over time into huge repositories of data," said Ovidiu Bivolaru, chief MPP engineer. "Customer feedback about the technology has been outstanding."
