

It's Time to Kill E-mail Spam, for Free!

While there are numerous proprietary e-mail security solutions around, how many actually manage to live up to their claims? And who says that customer service and satisfaction never come free? LFY tries its best to search out a solution that addresses these concerns.

With the ever-increasing popularity of the Internet and electronic messaging systems, there has been an increase in the need for e-mail security systems too. Whether you are a small organisation or have thousands of employees and have an e-mail server for your domain, you always need to spend a lot on fighting spam and viruses. SAFENTRIX provides a hosted and free e-mail security solution that keeps spam, virus and malware off your network, while ensuring that genuine e-mails always get through. SAFENTRIX achieves its goal by using a combination of popular open source tools, other than the anti-spam database.

SAFENTRIX, while claiming 100 per cent virus protection and over 99 per cent spam protection, can save up to 40 per cent of your e-mail bandwidth costs. And it's available in two flavours. The standard service is absolutely free, for any number of users, with no compromise on e-mail security. The premium service offers additional peace of mind through compliance with industry standards (HIPAA, GLB) and a 100 per cent service level agreement warranty.

SAFENTRIX uses seven different layers of spam protection to give you a spam and virus-free inbox. It uses IP checks, HELO

checks, selective grey-listing, sender address/domain validation, recipient address/domain validation, in-house proprietary blacklist checks, content checks to achieve efficiency. It can support up to 20,000 users per domain and also supports the same number of users for a sub-domain.

Easy to set up

Setting up the solution is very simple and does not require too much of technical expertise. It can be configured by anyone who has some knowledge of DNS, MX and A records. Neither does it require any changes in your current infrastructure and integrates seamlessly with the existing system. Also, it is compatible with all modern e-mail servers, including (but not limited to):

1. Microsoft Exchange Server
2. Lotus Notes
3. Qmail
4. Postfix
5. Sendmail

Apart from this, it supports all hosted e-mail services like Yahoo!, Gmail and others that provide POP/IMAP services.

SAFENTRIX can be installed and configured in three simple steps:

1. Register and create accounts using an automated process at <http://safentrix.com>.
