

You said it...

This mail offers a probable solution to the first question in the "You Said It" section in the July 09 issue, from Anuvrat Parashar. It seems that he gets Error 22 on Grub (no boot-able media/corrupt/missing, etc), due to his BIOS settings and not due to the DVD/CDs he's got. In certain BIOS (mainly found in HP/Compaq), there are hard disk modes such as:

- (1) IDE Controller: Compatibility / Enhanced
- (2) AHCI: On / Off

In this case, he can try to install by setting the BIOS mode to 'Compatibility' or 'AHCI Off' (whichever applies to his BIOS). This will, in most cases, solve the Grub Error 22. Hope this helps.

I am a systems administrator for a private institution. We want to deploy a mail server at our institution. We would like to use a Linux/OSS product only. Our institution has more than 75 employees and around 2,500 students. My query is, which free-of-cost mail server is best suited for a campus of our size.

—Somu .S, linux_3250@yahoo.com

ED: Typically, you'd require the following components:

- An MTA: You can choose from *qmail*, *Postfix* and *Sendmail*. At LFY we use *qmail*.
- An IMAP server: Choose between *Dovecot* and *Courier IMAP*.
- A Web mail software: There are quite a few solutions here. We use *Squirrel Mail*.
- Anti virus software (just to save those on the insecure Windows): *ClamAV*

- Spam filtering software: *SpamAssassin*
Of course, we'd recommend you read up on each of these solutions, compare their features and test them before fully deploying them.

I run Mandriva 2009 64-bit and I have an iPod Touch. All the information that I can find on the Net is related to syncing with Ubuntu and not Mandriva. Any ideas on where I can find information on syncing the iPod Touch with Mandriva.

—Marcus, mmatzick@gmail.com

ED: Since none of us here use iPod devices, we won't be able to provide you with any first-hand information. Under the circumstances, we'll leave it to our readers to address this problem. However, we do think that if you've chanced upon Ubuntu guides/articles/forum posts, you can apply the same steps on a Mandriva system too.

I have been following the various Linux distros that you distribute with the LFY magazine. I had tried Fedora, but found it to be too bulky for basic Internet browsing. After scouting around, I came across a program called Puppy Linux. This is really fast and needs very minimal hardware. I have been running it on a Pentium III machine with amazing results.

I thought I would share these views with your other readers. If you have a chance, please review it in one of your forthcoming issues.

—Narasimha Pingili,
pnreddy1942@yahoo.com

ED: We agree Puppy Linux is a very good OS for older systems. In fact, we did publish a review of version 4.1 when it came out last year.

I am amused by frequent news clips and articles in the press (including LFY), which state or rue the fact that Windows dominates between 90 to 95 per cent of the world's PCs. Microsoft itself recognises only genuine Windows. For the last 10 years, three out of every four PCs I have seen in homes as well as at offices, use pirated Windows, which cannot be recognised as Microsoft's share of the market. People continue to use pirated Windows simply because it works, they are used to it and are unwilling to change to open source due to some kind of mind block, or are just unaware of open source. Computer sellers are ever ready to load pirated Windows, but most of them now advise the customer to use OpenOffice.org instead of the MS Office suite. If all this is taken into consideration, one can easily arrive at what Windows' share of the market, actually is!

—J S Karkada, Bangalore

Errata

The Fedora review published in the July issue wrongly mentioned the Fedora 11 codename as Leonardo. It should have been Leonidas. We regret the error.
