

Enhanced PHP support in NetBeans 6.8

A new version of NetBeans IDE—which is supposed to provide all the tools needed to create professional desktop, enterprise, Web, and mobile applications with Java, JavaFX, C/C++, and dynamic languages such as PHP, JavaScript, Groovy, and Ruby—has come out. NetBeans 6.8 is now available for download packed with new features and improvements including: expanded PHP support; improved C/C++ profiling; improved code completion, hints and navigation for JavaFX; along with support for recently-released Java EE 6 and GlassFish v3. The new version also provides improved support for JSF 2.0/Facelets, Java Persistence 2.0, EJB 3.1 including using EJBs in Web applications and RESTful Web services, as well as improvements to the NetBeans Platform. The NetBeans platform is a Rich Client Platform that developers use to shave years off development time by reusing the modular NetBeans architecture. The platform uses Swing, which is the standard UI toolkit, enabling applications to have a consistent look and feel. Learn more at www.netbeans.org.

Official Google Chrome beta for Linux available

Google has finally officially released a beta version of its Chrome browser for Linux, which was until recently only available for Windows. The Chromium blog [<https://blog.chromium.org/>] featured the thoughts of the team as, "Google Chrome works well with both GNOME and KDE, and is updated via the normal system package manager. It has also been developed as a true open source project, using public mailing lists, IRC channels, a bug tracker, a code repository, and a continuous build and test farm—following in large part the trail blazed by Mozilla. Where we noticed problems in system libraries, we pushed fixes upstream and filed bugs. This open approach to development seems to be working: so far, about 50 developers outside Google have contributed code..." Visit www.google.com/chrome?platform=linux to get started.

GlassFish v3 promises increased flexibility

A new version of the Java EE-compatible application server, GlassFish is now available. Version 3 introduces features that increase the flexibility of the platform and enables companies to use the new lightweight Web Profile, in addition to the full enterprise platform, to help meet their business requirements.

The administration is extensible and enables extensions to be exposed through a Web console, CLI and RESTful API administration facilities. In addition, it supports a variety of GUI and CLI development tools including the NetBeans IDE, Eclipse, IntelliJ, Maven, Ant and others. GlassFish v3 runs a broad range of Java and non Java technology-based languages, including JRuby/Rails, Jython/Django, Scala/Lift, PHP, server-side JavaScript and Groovy/Grails. Visit <https://glassfish.dev.java.net/> for more details.

HP eyeing and bagging Sun Microsystems users

HP has partnered with Microsoft, Novell and Red Hat to provide customers with service offerings, incentives and training programs that streamline the migration from Sun to HP-based solutions, while reducing total cost of ownership. According to the company, in the 12 months ending October 31, 2009, more than 350 customers migrated from Sun systems to HP solutions. To simplify the migration process, HP claims to offer proof-of-concept, initial assessments, application migration, implementation and total life cycle services. The company's partners provide additional services to ensure that customers' data centre environments are fully supported.

Commercial Android for OMAP 3

Wind River has released a commercial version of Android optimised on the OMAP 3 platform. It's based on the latest versions of the Android SDK, available with pre-integrated software from initial partners Adobe, PacketVideo and Red Bend Software, along with global support by Wind River.

It's available with the following building blocks: enhanced UI and personalisation options for common branding functions; extended framework and applications including master reset function, music player; performance and power management; dedicated Wind River global customer support and services; and optimisation for leading mobile hardware including TI's OMAP34x and OMAP36x platforms. More details at www.windriver.com/oha and www.windriver.com/products/mobile-linux/android.html.
