

the kickstart files used to generate the images.

- **livecd-creator:** Part of the *livecd-tools* package, this is a tool to create a Live CD or DVD. You can also use the cross-platform Fedora Live USB creator or *livecd-iso-to-disk*, which is part of the same package in Fedora, to create a Live USB key as well. In Fedora 12 or any Fedora Remix derived from Fedora 12, you can simply use *dd* to do things quickly!
- **Revisor:** It is a powerful graphical tool that encompasses the functionality of both Pungi and *livecd-creator*. It provides a simple point-and-click interface.
- **fedora-kickstarts:** This is a package that includes a collection of kickstart files used by the Fedora Project's official releases, including the Fedora Spins available for download at <http://spins.fedoraproject.org>.
- **generic-logos:** This package provides non-branded equivalents to the *fedora-logos* package to enable anyone to rebrand the Fedora distribution and release it under any name they want!

Omega is a Live DVD that is derived from the official Fedora Desktop Live CD. To recreate something similar to it in Fedora 12, use the following code in your home directory:

```
[rahu@localhost ~]$ mkdir remix
[rahu@localhost remix]$ cd remix
```

Now, download the kickstart files for the Fedora Spins:

```
[rahu@localhost remix]$ su -c 'yum install fedora-kickstarts'
```

Set SELinux in permissive mode:

```
[rahu@localhost remix]$ su -c 'setenforce 0'
```

Copy two kickstart files to the current directory:

```
[rahu@localhost remix]$ cp /usr/share/spin-kickstarts/fedora-live-base.ks \
/usr/share/spin-kickstarts/fedora-livecd-desktop.ks
```

Open *fedora-livecd-desktop.ks* file in your favourite text editor and add any packages under the *%packages* section. @ in front of the package name denotes a package group. To list all groups, you can use the command given below:

```
[rahu@localhost remix]$ yum -v grouplist
```

A - (minus) in front of a package indicates that it should be removed from the image unless it is a dependency of another package.

Once you have the packages and package groups you wanted added, you must also rebrand the distribution. This is trivial. Just add the following to the

Test driving Omega 12: Sound & Video menu items

kickstart file you have opened.

rebranding

```
-fedora-logos
-fedora-release
-fedora-release-notes
generic-release
generic-logos
generic-release-notes
```

In the *%post* section of the kickstart file, add the following as the first line:

```
sed -i -e 's/Generic release/LFY Fedora Remix/g' /etc/fedora-release /etc/issue
```

Save the kickstart file as *lfy-fedora-remix.ks*. You have now successfully rebranded the distribution!

Just run the following command as the root user:

```
[root@localhost remix]# livecd-creator --config=lfy-fedora-remix.ks \
--cache=cache --fslabel=lfy-remix
```

The *cache* option indicates the download directory of the RPM packages needed to compose the Live image, and *fslabel* indicates the filesystem label/name of the remix. That's it!

You can download the Omega kickstart file from <http://omega.dgplug.org> if you would like to explore more. That should be sufficient for you to create your own distribution!

Hope you enjoy the world of Fedora Remixes.
