on TCP Port 1888, where the vault was required to be accessed.

- Finally, a rule was created to allow access from *customerpcs* to *customervault* by service *customervaultaccess*.

A marathon session of BOT configuration was successfully completed after grouping all the PCs, the required services, and creating various different rules to restrict the access according to the customer and security policy requirements.

After the successful installation, Kedar also discussed various other add-ons available for IPCop. These included *copfilter* (the gateway antivirus and anti spam module for monitoring traffic through a firewall as well as e-mail attachments); *Layer7Filter* to enable filtering based on application; and *Calamaris*, which is a log file parser and

report generator that gives the ability to create customised, detailed, menu-driven proxy reports.

The aftermath

With that, the customer's conditions for contract renewal were fully satisfied. New work started arriving and Shree was a happy person once again. As an added benefit and at no extra cost, security policies for the company's network and for Internet access were prepared and implemented, effectively securing the computer network.

To recap, IPCop is a stable, flexible, features-rich and very reliable firewall. Basic installation and configuration is straightforward. However, its implementation requires in-depth technical knowledge. **END**
