

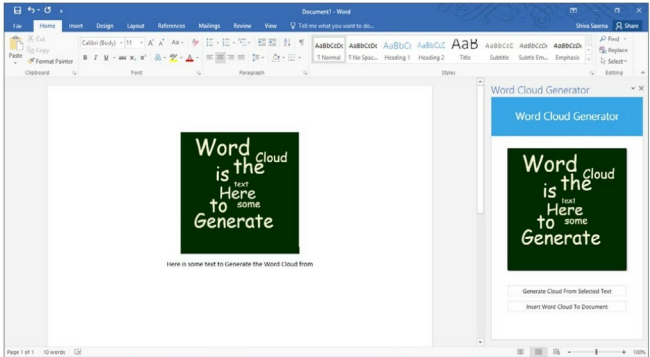

Figure 2: Screenshot of our word cloud add-in

- the Manifest file in the editor. Select the *Activation* tab, and in the *Application* section, choose Word as the only option as we are targeting only Word. Now, in the *Required API sets* section, add the *ImageCoercion* API set. It is required to insert images into the document.
- Now navigate to the *Word Cloud Generator Web Project*. In this article, we will only work with the standard project structure, except for downloading the *wordcloud2.js* file from *Github.com* and adding it to the *Scripts* folder.
 - Open the *Home.html* file located in the *Addin> Home* directory and remove all the contents from inside the `<body>` tag. Then add *wordcloud2.js* inside the `<head>` tag as follows:

```
<scriptsrc="../../Scripts/wordcloud2.js"></script>
```

- After this, we will create a header in the page with the application name, a `<canvas>` element to contain the word cloud, with two buttons to generate a new word cloud from the selected text and to add the word cloud into the document. It can be achieved by adding the following code in the markup inside the `<body>` tag.

```
<div id="content-header">
<h1 style="text-align:center;font-weight:bold;padding-top:10px;">Word Cloud Generator</h1>
</div>
<div id="content-main">
<div id="word-cloud-container">
<canvas id="word-cloud-placeholder" width="250" height="250"
```

- ```
class="canvas"></canvas>
</div>
<div id="word-cloud-btn-container">
<button id="cloud-from-selection">Generate Cloud From
Selected Text</button>
<button id="insert-cloud-to-document">Insert Word Cloud To
Document</button>
</div>
</div>
```
- Open the *home.js* file in the same directory. Here, we will define a *draw()* function that will take a string as parameter, split it into words and generate a word cloud out of it.

```
function draw(words) {
 var list = [['This', 20],['is', 18],['the',
16],['default', 15],['Word', 22],['Cloud', 20]];
 if (words) {
 var newList = [];
 var regex = /[^\s\.,!?]+/g;
 var individualWords = words.match(regex); //
Split individual words from sentences
 if (individualWords) {
 individualWords.forEach(function(word) {
 var wordEntry = [];
 wordEntry.push(word);
 wordEntry.push(Math.floor(Math.random() *
15) + 1);
 newList.push(wordEntry);
 });
 list = newList;
```
