tell you how to download it.

1. In the top row, click on the *Build* button. It will show you the option to download the APK to your computer.
2. While downloading this, you can see its progress and after a successful download, the application will be placed in the download folder of your directory or the preferred location you have

set for it.

3. Now you need to get this APK file to your mobile phone either via Bluetooth or via USB cable. Once you have placed the APK file on

your SD card, you need to install it. Follow the on-screen instructions to install it. You might get some notification or warning saying, "Install from untrusted source." Allow this from the settings and after successful installation you will see the icon of your application in the menu of your mobile. Here you will see the default icon, which can be changed, and we will tell you how to do this as we move ahead on this course.

I hope your application is working exactly as per your requirements. Now, depending upon your needs and customisation, you can change various things like the image, sound and behaviour also.

Debugging the application

We have just created the prototype of the application with very basic functionality. What else might the user be interested in? Now, let's look at various cases which require serious thought so as not to annoy the user. Then let's ensure that your app addresses these requirements. Consider the following cases:

1. Wouldn't it be nice to add some background for Screen1?
2. What other ways could we use to trigger the SMS and call functions rather than clicking the button?
3. Wouldn't it be nice if we could provide a recording feature to capture all that is happening around the user during that period of danger?

These are some of the possible scenarios that could occur and users will be pretty happy seeing these problems addressed.

Think about all these scenarios and consider how you could integrate these into the application. Do ask me if you fail to address any of the above requirements.

You have successfully built another useful Android app for yourself. Happy Inventing! **END**
