

SimpleCV: Making Vision Computing Easy and Effective

SimpleCV makes computer vision tasks simpler and quicker to implement by providing a wrapper over the underlying complex code in the OpenCV library. In addition to this, SimpleCV provides functionalities such as optical character recognition (OCR) through easy-to-use functions.

Computer vision is a domain that's under active research, with applications spreading across a spectrum of fields such as robotics, human computer interaction (HCI), etc. Computer vision involves tasks such as image reception, processing, reasoning, video stream handling, etc. These tasks involve a lot of mathematical processing, which is not easy to implement. To handle this problem and make the life of the developer simpler, frameworks like SimpleCV become handy.

SimpleCV

SimpleCV is an open source framework for performing computer vision tasks. And like its name suggests, it has made computer vision *simple*. The complexities associated with

OpenCV have been taken care of in SimpleCV by providing direct-to-use functions for performing repeatedly used computer vision tasks. SimpleCV is written in Python and can be installed in all major operating systems such as Linux, Windows and Mac. It is available with the BSD licence.

SimpleCV allows developers to handle both images and videos. The source image/video is acquired directly using various input sources as listed below:

- Web cams
- Kinects
- FireWire and IP cameras
- Mobile phone cameras

SimpleCV facilitates not only making changes to the images but also allows them to be understood.
