

used directly in a terminal window or via a bash script as reported in the following code, which generates N passwords of M length:

```
#!/bin/bash
# Password generator
M=$(zenity --entry --title='Password' --text='Minimum password length:')
N=$(zenity --entry --title='Password' --text='Generate n passwords:')
apg -a 1 -m $M -n $N
```

Freeplane, NetBeans and Scilab

Because the software repositories are a bit outdated, it can be interesting to download the latest version directly from the developers' website for some applications. Presented here are three examples.

Freeplane is an interesting Java based mind mapping software. Download the latest version `freeplane_bin-1.3.15.zip` from <https://sourceforge.net/projects/freeplane>, unpack it in your home directory and then run it using `/home/your-username/freeplane-1.3.15/freeplane.sh`. See the top part of Figure 4 (*Settings > Menu editor > Add launcher*). The application icon is `/home/your-username/freeplane-1.3.15/freeplane.svg`.

A Java Development Kit must be installed before NetBeans. An easy way is to install `openjdk-7-jdk` from the *Software manager*. The last version for Linux `netbeans-8.1-linux.sh` can be downloaded from <https://netbeans.org/downloads>. The installation involves the following two steps from the terminal:

```
chmod +x netbeans-8.1-linux.sh
./netbeans-8.1-linux.sh
```

During the installation process, be careful to install the NetBeans IDE in `/home/your-username/netbeans-8.1` and the JDK location that's `/usr/lib/jvm/java-7-openjdk-i386`

The latest version of Scilab `scilab-5.5.2.bin.linux-i686.tar.gz` can be downloaded from <http://www.scilab.org>, which you can then unpack to your home directory. Last of all, run Scilab using `/home/your-username/scilab-5.5.2/bin/scilab` (see Figure 4, middle). The application icon is `/home/your-username/scilab-5.5.2/share/icons/hicolor/256x256/apps/scilab.png`

jEdit, Emacs and Vim

It's not possible to install the last stable version jEdit 5.3.0 due to issues with the preinstalled Java.

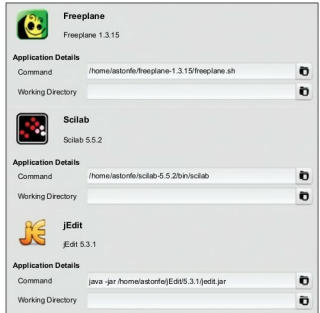

Figure 4: From top to bottom, the launchers for Freeplane, Scilab and jEdit

But it's possible to install jEdit 5.3.1 (a development trunk). Download `jedit5.3.1.install.jar` from <http://www.tellurianring.com/projects/jedit-daily> and then install it from the terminal with `java -jar jedit5.3.1.install.jar`. To run it, simply use `java -jar /home/your-username/jEdit/5.3.1/jedit.jar` (see Figure 4, bottom). The icon is `/home/your-username/jEdit/5.3.1/doc/jedit.png`. If you have your own syntax-highlighting file, you can add it in the modes directory `/home/your-username/jedit/modes`. In this case, you must also add a row to the catalogue file, for example:

```
<MODE NAME="scilab" FILE="/scilab.xml" FILE_NAME_GLOB="*.sce" >
```
