

Figure 5: Ethernet networking in Android

Some more battery-saving tips

Apart from disabling unwanted apps and services, there are other things you can do to save on battery life.

- Optimise device and app settings.
- Minimise the number of apps you need to have. One RSS feed reader app can eliminate several dedicated apps. If a

site offers RSS feeds, use the RSS feed instead of its app. Browse anonymously.

- Turn off services such as mobile data, Wi-Fi and GPS when they are not required.
- Turn off your phone when you are travelling because it will waste more energy trying to connect to transient cell towers.
- Enable the Ethernet networking option in Android tablets. Use a USB LAN adapter with your OTG cable so that you can use a wired connection. Yes, use a LAN cable. Disable Wi-Fi in your router and enable Airplane Mode in the tablet. This option is not available on Android phones as, of course, they do not have Ethernet drivers.

Finally, a security tip: Do not let your phone connect to any free Wi-Fi access point. Wi-Fi routers get infected with viruses and are now a favourite hacking method. Botnets work because of compromised routers. You could instead rely on a mobile data plan and use it only when necessary. **END**
