

DVD OF THE MONTH

Try out the latest powerful Fedora.

Fedora 24 Workstation Live (64-bit)

Fedora Workstation is a reliable, user friendly and powerful operating system for your laptop or desktop computer. For details on how to install it, you can visit <http://docs.fedoraproject.org/install-guide>. The bundled DVD can boot into a live version of Fedora 24 64-bit for you to try out. The 32-bit version of the OS is available in the *other_isos* folder on the root of the DVD.

Fedora 24 Server

Fedora Server is a short-lifecycle, community-supported server operating system that enables seasoned systems administrators with experience on any OS to make use of the very latest server-based technologies available in the open source community. It is a powerful, flexible operating system that includes the best and latest data centre technologies. The bootable *netinstall* image is available in the *other_isos* folder on the root of the DVD.

Fedora 24 LXDE Live

LXDE, the 'Lightweight X11 Desktop Environment', is an extremely fast and energy-saving desktop environment. LXDE is not designed to be powerful and bloated, but to be usable and slim. The main goal of LXDE is to keep computer resource usage low. It is especially designed for computers with low hardware specifications or older computers.

This stable release can be installed or tried live from the bootable ISO images available in the *other_isos* folder on the root of the DVD.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation. To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.

To use the image available in the *other_isos* folder, you either need a drive that can create or 'burn' DVDs, or a USB flash drive at least as big as the image, or you can use it directly with any virtualisation software like VirtualBox.
