

Red Hat JBoss EAP 7 released to support hybrid cloud applications

Red Hat announced the release of its JBoss Enterprise Application Platform 7 at the Red Hat Summit 2016 in San Francisco. The new platform, known as Red Hat JBoss EAP 7, is “...to bridge current and future development paradigms” and to support hybrid cloud applications through a set of new technologies.

The original Red Hat JBoss EAP was designed to bring open source closer to the enterprise world. Its new version comes with the same focus but uses some new technologies to support DevOps development practices. The platform now has the widely deployed Java EE APIs, as well as Red Hat's JBoss Developer Studio and JBoss Core Services Collection.

“With JBoss EAP 7, we are addressing the needs of both enterprise IT and developers with a balanced vision designed to bridge the reality of building and maintaining a business today with the aspiration of IT innovation tomorrow,” said Mike Piech, VP and GM of middleware, Red Hat.

JBoss EAP 7 has JBoss Core Services Collection that provides developers with some common foundational building blocks to develop new enterprise applications. Additionally, there are management and monitoring capabilities for existing applications and services. The Collection package includes Red Hat JBoss Operations Network, Apache HTTP server and a sign-on server.

Red Hat considers its JBoss EAP 7 as a ‘new milestone’ that would help the open source solutions provider extend its present product portfolio and attract more partners. Likewise, the platform advances the existing experience with new application approaches like containers and microservice architectures.

at the Centre comprises engineers who are well versed in open source solutions architecture as well as essential software development and support capabilities.

“NEC and NTI will leverage the newly established OSS Technology Centre to provide rapid support to users carrying out the construction of OSS-based systems on a global scale,” said Nobuhiko Kishinoue, general manager, cloud platform division, NEC Corporation.

The Technology Centre will carry out development of new network functions related to Software-Defined Networking (SDN) and Network Functions Virtualisation (NFV). It will also help in developing application platform functions like Platform-as-a-Service (PaaS). Besides, the organisation will contribute to making source code openly available.

“We will be able to utilise the large experienced and English-speaking engineering resource pool in India for the new centre. We plan to hire both fresh university graduates and experienced corporate engineers. The OSS Technology Centre initiative is an umbrella organisation for all OSS related activities between NTI and NEC to be brought together under one task force,” said Anil Gupta, MD and CEO, NTI.

NEC Corporation estimates that business for open source software will increase in the future. Therefore, the new centre could soon become fruitful for the Japanese company.

Next Android version to have nougat flavour

Google has formally revealed the official name of the next Android version. It won't be the highly anticipated Nutella, but Android Nougat.

Android Nougat emerged as a result of Google's crowdsourcing attempt at its

annual I/O conference last month. The new version will succeed last year's Android 6.0 Marshmallow and come with features such as multi-window support and direct reply. Additionally, it will provide improvements in the existing offerings like Doze and Data Saver mode.

For developers, Google has already started releasing N Developer Preview builds with some

unique peculiarities. While the first preview version came preloaded with a new JIT compiler to enhance the overall performance of the software and apps, the second build brought with it new 3D rendering API Vulkan. Notifications also got revamped with several noticeable enhancements.

Google hasn't revealed the release date of its new Android version. However, the final SDK for Android N was released in early June, this year, to let developers test their apps on the upcoming operating system ahead of its formal rollout.

Android Nougat might not be a game changer for the mobile world. But with the new release, Google is aiming to get bigger.
