

Figure 8: Running PhoneGap application in the Android Emulator

Figure 9: Output of PhoneGap application

```
<icon src="icon1.png" platform="ios" width="100" height="100"/>
```

2) By putting the icon or splash inside a platform element:

```
<platform name="ios">
  <icon src="icon1.png" width="100" height="100" />
</platform>
```

Both these statements will give the same result—that the icon is being used for iOS.

Developing a Hello World application for Android

To build an app for Android, you need the following prerequisites on your machine:

- 1) Java SDK
- 2) Android SDK
- 3) Eclipse
- 4) Eclipse ADT plugin
- 5) Android platforms and components
- 6) Apache Ant
- 7) Ruby
- 8) PhoneGap framework

Table 1

API	Usage
Battery status	Monitors the status of the device's battery
Camera	Captures a photo using the device's camera
Console	Adds additional capability to console. log()
Contacts	Works with the device's contact database
Device	Gathers device-specific information
Device Motion (Accelerometer)	Taps into the device's motion sensor
Device Orientation (Compass)	Obtains the direction that the device is pointing
Dialogs	Visual device notifications
File Transfer	Hooks into a native file system through JavaScript
Geolocation	Makes your application location aware
Globalization	Enables representation of objects specific to a locale
Media	Records and plays back audio files
Splashscreen	Shows and hides the application's splash screen
Vibration	An API to vibrate the device
StatusBar	An API for showing, hiding and configuring the status bar's background

Now, make an environment variables check.

Set the following values to your account's PATH variable:

```
system_path/jdk/bin
system_path/android-sdk/tools
system_path/ruby/bin
system_path/apache-ant/bin
```

Also set the following variables:

```
JAVA_HOME - path of JDK directory
ANT_HOME - path of apache-ant directory
ANDROID_HOME - path to android SDK directory
```

To create a workspace for your app, go to the 'phonegap-android' folder on the command prompt:

```
ruby ./droidgap "[android_sdk_path]" [name] [package_name]
"[www]" "[path]"
android_sdk_path: Where you have installed the Android SDK
name: Name of the application.
package_name: The name you want to have for your application.
www: The path of the folder where you want to have your
PhoneGap app files.
path: The application workspace for your project which you
will add afterwards.
```
