Figure 5: Inventory output

- Which host is running *database server*? It's localhost/Ipaddress.
- On which port is the *database server* running? The default port 3306.
- Where is the Apache daemon binary [/usr/sbin/httpd]? For default, press *enter*.
- Where is the Apache main configuration file? The default configuration file is */etc/httpd/conf/httpd.conf*, which you choose depending on your requirement.
- Which user account is running the Apache Web server? Choose Apache.
- Which user group is running the Apache Web server? Choose Apache.
- Where is Apache Include configuration directory? The

default is */etc/httpd/conf.d*

- Where is the PERL Interpreter binary? The default is */usr/bin/perl*
- Do you wish to set up a communication server on this computer ([y/n])? If you want to do so on the same one, press 'y' or 'n'. 'y' is the default here.
- Where should one put the communication server log directory? The default location is */var/log/ocsinventory-server*
- Where should one put the communication server plugins configuration files? The default location is */etc/ocsinventory-server/plugin*
- Where should the communication server plugins Perl modules files be placed? The default location is */etc/ocsinventory-server/perl*

After this, it will check all Perl modules and may throw an error for a missing SOAP::LITE module, even though you've installed it. Just continue to the next questions.

- Do you want to allow the set-up renaming the communication server's Apache configuration file to 'z-ocsinventory-server.conf' ([y/n])? Press 'y' and then *Enter*.
- Do you wish to set up the administration server (Web Administration Console) on this computer ([y/n])? Press 'y' and then *Enter*.
- Do you wish to continue ([y/n])? -> You can select 'y' as this is our first installation and not an upgrade.
- Where should one copy the administration server static files for the PHP Web console? The default is */usr/share/ocsinventory-reports*
- Where should one create writable/cache directories
