

Google will now train two million Android developers

Sundar Pichai has become the CEO of Google and he has a lot to deal with, but it is Android that remains his favourite, it seems. Pichai, during his three-day visit to India, announced that the company has plans to train as many as two million Android developers across the globe.

Addressing the audience at the Shri Ram College of Commerce (SRCC) in New Delhi, Google's CEO said, "As per the new plan (by Google), we will train two million Android developers in partnership with 30 universities. This will be done over the time period of the next three years. For me, getting many more developers into the workforce is going to solve many new things."

Pichai also expressed excitement about the public Wi-Fi project in India. He said, "It is the largest (such) project in the world, wherein 400 railway stations will get Wi-Fi Internet. The reason we are doing this is that in India, when you bring access to the Internet, it changes the lives of people."

Here comes the first Manjaro Linux Deepin 15.12 Edition

This Linux OS appears to be truly gorgeous. Manjaro Linux developer Bernhard Landauer has announced the release and immediate availability of the first stable version of the Manjaro Linux Deepin Edition.

This variant of the Linux OS is based on the stable Manjaro Linux 15.12 (Capella) operating system and offers one of the best Deepin UI desktop experiences. Manjaro Linux Deepin 15.12 Edition is a community project and is the result of months of hard work by the developers.

Making an announcement about this, Landauer said, "My thanks fly out to this awesome community that infected me with this originally quite insane idea and then kept pushing, correcting, motivating and encouraging me for more than three months until it finally seemed possible to achieve this. Then, of course, without some exceptional people at Arch and Deepin, this would not have been possible at all, especially *fasheng*, *felixonmars*, *mmetak* and *jouyouyun*."

It should be noted that the Manjaro Linux Deepin 15.12 Edition is based on the same Linux kernel packages as those in Manjaro Linux 15.12 (Capella). It is powered by Linux kernel 4.1 LTS (long-term support) and will support the latest hardware components, including the most recent laptops and desktops.

It is also packed with the major Manjaro Linux 15.12 goodies, including the Manjaro-Welcome, Manjaro-Settings-Manager, Manjaro-Printer, as well as the Calamares, Thunar and CLI installers.

Makers of the OS have also included a wide selection of open source applications like Chromium, Evolution, LibreOffice, Nautilus, Xarchiver, GIMP, Evince, Gthumb, Xfburn, XSane, Yaourt, GParted, PulseAudio, Calculator, Dconf-Editor, Isousb, Pamac, and optionally, Mutter, Gala or Metacity windows managers.

Google opts for Open SourceJDK over Oracle's Java

Google has announced that beginning from Android N, it is going to stop its dependence on Oracle's Java and will go for open source OpenJDK.

Although Google states that the reason for this is to root for open source software, there seems more to it. Ever since Oracle acquired Sun Microsystems in 2010, it has been in a tussle with Google over Android. Oracle claims that Android utilises its JavaAPI without prior permission. Google claims that no one can copyright APIs. This had led to a debate between the two. Till date, the issue has not led to any legal resolution. Even though a jury supported Google's view on APIs in 2012, the federal court reversed the decision, claiming that APIs could indeed be copyrighted. The Supreme Court refused to even hear the case out in June last year, bouncing it back to the lower courts.

But Google has not taken a stance on that point and is inviting attention to the open source aspect of Android. This involves the use of source libraries as well. This change was evident in a source code commit that is now being confirmed by Google to be the scene for all future Android versions.

Users will not notice any difference as OpenJDK is a complete stand-in for Oracle's proprietary implementation. Developers may not need to choose between the two and can standardise on just one. Google will benefit, as this move will pave the way for how open source implementations get developed to benefit Android directly.
