

Figure 3: One of the certificates generated

Type the following command to give executable permissions to your script:

```
//switch to the directory
cd /usr/lib/gimp/2.X/plugin-ins
//give permissions
sudo chmod +x <your_script_name>.py
```

Now, to run it:

1. Open GIMP
2. Navigate to *Filters->Python-fu->Certificate Generator*
There it is! A window appears asking for the path to the template, *list* file and output directory.

These can be typed or selected using the file browser.

Click 'OK' to run the script and the certificates are generated in the output directory specified.

Additional notes

If the plugin does not appear in GIMP, run GIMP from the `/usr/lib/gimp/2.X/plugin-ins` directory; if there are any errors, they are shown in the terminal. Also try running the file as follows:

```
$ python <your_script_name>.py.
```

It should only show an error related to *gimpfu*; if not, try to fix the error shown.

The text is black in colour here. For additional information on how to change the background/foreground and how to view the plugins in GIMP, head over to *References*.

While creating the text layer in GIMP (the `<name>` one), create the rectangle large enough for the longest possible name. **END**

The author is an open source software enthusiast and wants to do all that is possible to promote its everyday use. He can be reached at sraghavmdu@gmail.com

Continued from page 43...

```
int b_;

};

int main()
{
    Base b(10);
    Derived d(11, 21), dd(15, 25);

    b.print();
    d.print();

    Base &bb = d;    // Assign Derived class object to Base
    class object.
    bb = dd;

    bb.print();

    return 0;
}
```

Let's look at the output now.

```
----- output -----
```

```
In Base: a_ = 10
In Derived: a_ = 11 and b_ = 21
In Derived: a_ = 15 and b_ = 25<- After correct copying
```
