

FooBar2000: I am listing this player for a specific reason. It has a different relevance for different people. For casual music listeners, it can be as easy-to-use as any other player, and for music buffs who are always looking for something tricky with lots of advanced and customisable features, FooBar brings all of them.

The most important benefit of using FooBar2000 is that it has a very small footprint on the CPU, memory and disk compared to any other music player. It allows experienced computer users to customise anything and everything to their liking. Another important feature is direct access to each music file irrespective of its location.

Two most powerful features of FooBar2000 are title formatting and query syntax. Title formatting is a scripting language which works around functions, return values and variables. FooBar uses it for strings, date manipulations and semi-processed tag handling.

Media Monkey: This player makes the list just on account of its popularity. Regarding features, Media Monkey is very similar to Music Bee - it offers support to a whopping 100,000 files and playlist types while making them easy to tag and organise. It also offers you features like auto organiser and auto tagger, which do all the work of arranging and tagging for you and let you set the player to display the information you want it to display.

Media Monkey supports all formats including iTunes, and can rip and burn CDs for you.

Developers' section

But this is not only about playing music and having fun. If you are an open source enthusiast and want to contribute to these projects, you can do so and make your name.

Check these out at:

- I have tried listing the five best and most popular music players that are available across platforms as open source applications. There are many more such

players around like AIMP3, Winamp, XMPlay, JetAudio, etc, and selecting the best among them is a point of argument. The above list can be of help in choosing the best for you. **END**
