

You will notice that the new block device is added to your system configuration.

4. You can create partitions and format the disk using the `fdisk` and `mkfs` commands, as follows:

```
# fdisk -l /dev/sdb4
```

```
Disk /dev/sdb4: 536 MB, 536870912 bytes, 1048576 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
```

You can format to `ext4` by using the following commands:

```
# mkfs.ext4 /dev/sdb4
mke2fs 1.42.9 (28-Dec-2013)
Discarding device blocks: done
Filesystem label=
OS type: Linux
Block size=4096 (log=2)
Fragment size=4096 (log=2)
Stride=0 blocks, Stripe width=0 blocks
32768 inodes, 131072 blocks
6553 blocks (5.00%) reserved for the super user
First data block=0
Maximum filesystem blocks=134217728
```

```
4 block groups
32768 blocks per group, 32768 fragments per group
8192 inodes per group
Superblock backups stored on blocks:
    32768, 98304
```

```
Allocating group tables: done
Writing inode tables: done
Creating journal (4096 blocks): done
Writing superblocks and filesystem accounting information: done
```

You can perform various file operations on this partition, which are exported by the target and used by the initiator.

SCST provides lots of configuration for the virtual disk created. You can check more details on the documentation page at http://scst.sourceforge.net/target_iscsi.html. You can also contribute to SCST code at <http://scst.sourceforge.net/contributing.html>, and get the latest details about SCST by subscribing to a mailing list at <https://lists.sourceforge.net/lists/listinfo/scst-devel>
