

DVD OF THE MONTH

A great choice for sysadmins, developers and desktop users.

openSUSE Leap 42.1

This is one of the most usable and stable Linux based operating systems for regular use. openSUSE Leap is a free OS for your PC, laptop or server. You can surf the Web, manage your e-mails and photos, do office work, play videos or music and have a lot of fun! The DVD contains a large collection of software for desktop or server use.

It is suitable for installation or upgrade. You can boot from the bundled DVD to explore the power of Linux. In case your computer does not automatically boot from the chosen device, open the BIOS set-up to allow booting from it. After booting, select 'Install' from the menu screen and follow the onscreen instructions for installation.

openSUSE comes with one of the best installers. The DVD gives you the option to install Linux with GNOME, KDE or others as a desktop environment (DE).

This release of openSUSE comes with KDE Plasma 5, LibreOffice 5, GNOME 3.16 and GNU Compiler Collection 4.8.5 with the option of GCC 5.2.

Leap has developed the Btrfs file system as the default option and an XFS data file system for performance, but there are several other options to choose from. The benefit of Btrfs is that it allows users to take advantage of Snapper, a powerful tool that can be explored further.

You can find more information on installation in the documentation directory on the DVD.
