

Red Hat and Microsoft join hands

One time rivals Microsoft and Red Hat have come a step closer on the emerging platform of the cloud. Red Hat has added support for Microsoft's Azure cloud to its latest release of CloudForms hybrid cloud management. With the support of Azure, Microsoft stores will be able to manage Azure Workloads and resources from within CloudForms.

Red Hat's Infrastructure-as-a-Service, CloudForms, has managed a mix of architectures for the private and public cloud. It will act as a supporter for Microsoft's cloud. CloudForms will enable you to mix architectures for the public and private cloud.

Calibre 2.46.0 adds support for new Kobo firmware

Calibre 2.46.0, the open source e-book library management software for GNU/Linux, Mac OS X and Windows operating systems, is out. According to the release notes, Calibre 2.46.0 adds support for PDF bookmarks, which can be used as the metadata ToC (Table of Contents), implements a new tool that compresses images in books without loss of quality, and adds support for a new firmware for Kobo e-book readers. Also, there is a new tool in the edit books segment, which compresses the images in the books without compromising on the quality. Hardlinks are used to move entire e-book libraries, making the entire operation faster.

There is better support for moving e-book libraries while saving a copy in the directory of the original in the library. Users can also warn about the broken trailing data entries in MOBI.

The single value custom text column is now clickable in Book Details. The Amazon and Amazon EU stores have been disabled in Calibre. The new Calibre can be downloaded for GNU/Linux, Mac OS X and Microsoft Windows systems operating on Softpedia.

Here comes PHP 7 — the biggest update in years

PHP enters its seventh edition and this one is surely among the biggest updates to one of the most popular programming languages in the world. As per the statistics, PHP has been powering as many as 200 million websites across the globe, along with over 81.7 per cent of the public websites running PHP on the server side.

With the new upgrade, PHP has taken a giant leap. PHP 7 is the first major updated version of the programming language since 2004, when PHP version 5.0 was released. This new version of the PHP programming language comes with some major improvements and is about

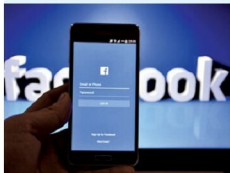

three times better in terms of performance when compared to PHP 5.6.

The new update also has some smaller, yet significant changes including the return type declarations, reduced memory usage, the spaceship operator, et al.

Some changes that make PHP 7 a pathbreaking update are magic quotes, removal of PHP safe mode, and a number of new reserved keywords. With these changes, Web apps like WordPress will now have to be partially re-engineered to be PHP 7 ready.

Facebook to share artificial intelligence technology

Facebook is releasing free designs of a new computer server, which promises to be two times faster than the existing one. The main reason is to put more power behind the artificial intelligence software. Facebook's new design 'Big Sur' has been created by a powerful learning software, which will process data using roughly stimulated neurons. An MIT scholar once said that it was crucial to put more power behind deep learning. Use of graphics processors was crucial to the recent leaps in the ability of computers to understand language, speech and images too.

Facebook has worked closely with Nvidia for its new server design, which has been crammed with more chips. The hardware has used Google's TensorFlow software.

Although it is not clear why Facebook wants to open source its technology, this move might lead to accelerating progress in the broader field while helping companies boost their reputation.

TensorFlow was launched by Google in November, soon after which Microsoft released a software which evenly distributes machine learning software across multiple machines.
