

Click 'View Certificates' button and choose 'Authorities' tab
Click 'Import' button, select and accept the myCA.der file that was created above.

It should now be possible to browse any site, including the *https* sites.

However, Google Chrome may insist that the certificate is suspicious even if you have explicitly imported it because of special handling of *google.com* and related sites by Google Chrome. There should be a solution for it to work with *ssl_bump*; however, I have not explored the possibilities.

Android tablet: You will need to import the certificate on an Android system as follows:

copy myCA.der as myCA.crt on the android device on Internal storage in, say, Documents folder.
From the Settings application, select Security from Personal settings
Choose Install from USB storage
Go to the Documents folder under Internal Storage
Select myCA.crt from the list of files
Give it a name and click ok.

Now, on the Android tablet, enable the proxy settings, as shown below:

Go to WLAN in Settings
Long press the connected WiFi network.
Select Modify Network and Advanced options
Configure the proxy host and the port.

You should be able to browse and the apps should work fine. You can monitor the *access.log* of Squid to see that everything is working as it should.

You will, however, find a warning that the network may be monitored in the notifications. You may ignore the warning since you know that it is your own proxy that is the culprit.

So is Squid proxy worth the trouble? I am not sure; however, it is definitely interesting to understand it and get it to work.
