Using the FreeIPA server with the Web UI

The FreeIPA server provides a Web user interface for easy management and administration of various services provided. Logs related to the Web UI can be found in `/var/log/httpd/error_log`. After installing and configuring the FreeIPA server successfully, go to `http://<ip-address-or-fqdn-ipa-server>/ipa/ui`. FreeIPA uses self-signed certificates for encryption, so Firefox or any other browser will prompt the user for adding an exception for an untrusted connection to FreeIPA server. After proceeding to the login page, the user will be prompted for the username and password. The first time, the user can use `admin` user with the password specified at the time of installation using the `-a` option in the `ipa-server-install` command.

After successful login, users will land on the dashboard page.

The user can be added from the same page using the `Add` button on the user page.

User details can be viewed by clicking on individual users in the *User Page*. The administrator can also edit/modify users' details.

The administrator can change various FreeIPA related configuration settings using the *Configuration* tab found in the IPA server section. In this section, the administrator can modify settings such as the default shell used by users, the default email domain name, password expiration notification, and many other settings.

The administrator can also manage various things such as the domain name server, the certificate system (CS) using FreeIPA server, etc. Settings for DNS and CS can be found under *Network Services* and *Authentication* sections, respectively.

FreeIPA is an open source project written in Python. You can contribute to it by writing code, testing and documentation. Details related to contribution towards FreeIPA can be
