

The Garden module does not have any package at the initial level. Every package or module is required to be downloaded at runtime using Pip, as follows:

```
# Installation of kivy-garden package
$ garden install <PackageName>

# Upgrading any package of garden
$ garden install --upgrade <PackageName>

# Uninstalling any garden package
$ garden uninstall <PackageName>

# Listing of all the garden packages already installed
$ garden list

# Searching new packages
$ garden search

# Searching packages containing "media"
$ garden search media

# Getting the Help
```

```
$ garden --help
```

Scope for R&D

Research scholars and engineers can perform a number of experiments for their research assignments and dissertations using multiple mobile platforms. One of the classic examples is the pragmatic analysis of the performance of different mobile frameworks. In the course of doing this work, the same application can be developed on different platforms including Android, Kivy and Codename One. After execution of the app, the different parameters including execution time, delay and related cost factors can be compared with graphs and tables. Using this approach, the actual difference between the performance levels of multiple platforms can be evaluated with empirical results.

3. Now you need to get this *apk* file to your mobile phone either via Bluetooth or USB cable. Once you have placed the *apk* file on your SD card you need to install it. Follow the on-screen instructions to install it. You might get some notification or warning about installing from an untrusted source. Allow this from the settings, and after successful installation you will see the icon of your application in the menu of your mobile. Here you will see the default icon which can be changed, as you will learn as we move ahead in this course.

I hope your application is working exactly as per your requirements. Now, depending upon your usability and

customisation, you can change various things like images, sound and even behaviour.

Debugging the application

We have just created the prototype of the application with very basic functionality and let's look at what else might interest users. Now come various cases which require serious care so that users are not annoyed by your app. Consider the following cases:

1. Is there any way to edit the previously saved notes?
2. Can we delete any previously saved notes?
3. Rather than directly quitting the application, can we have a confirmation notification before the user completely gets out of the application?

These are some of the scenarios that might occur and the user will be pretty happy seeing those implemented.

Think about all these scenarios and how you can integrate them into the application. Do ask me if you fail to accomplish any of the above cases.

We have successfully built another useful Android app for ourselves. Happy inventing!
