

Figure 1: Creating a database for WordPress

Figure 2: Select the language for your WordPress site

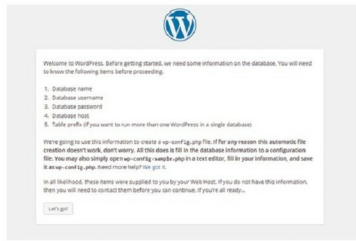

Figure 3: The WordPress Welcome screen

Database name: We have just created the database for our website and named it `wordpress_db`.

Database user name: The default user name for WAMP server is root.

Database password: The default password for the WAMP server is blank, so leave it blank.

Database host: Here, our host name is localhost.

Just click on the **Let's go** button because now, we know everything.

- The third screen is for entering database connection details. Here, you will find something called **Table prefix**; just enter 'wp' in it, which is the default prefix of WordPress. Enter all the details and submit it.
- After that, just continue with the installation.
- On the next screen, fill out the installation form. You need to provide a title for your website, choose

Figure 5: The Install WordPress button

an admin user name and password, and provide the admin's email address. Finally, press the **Install WordPress** button.

- Now, it's time to proceed to our first WordPress site by clicking on the **Login** button.

Logging in to your first Web application

To view the website, just go to `http://localhost/wordpress/`.

To log in to our Wordpress site's admin panel, go to `http://localhost/wordpress/wp-admin/`.

The details are the same as what we gave at the time of installation:

Username: `admin`

Password: `wordpress123456`

So log in and set up your blog or whatever you would like to use this site for. **END**
