

Wipro partners with Hortonworks to open source Big Data tech

Wipro has announced its formal partnership with Hortonworks to open source its Big Data technology. Called Big Data Ready Enterprise (BDRE), the new open source product is to be released under the Apache Public License v2.0.

To give a boost to its existing open source practice, Wipro is set to offer BDRE for both individuals and organisations. This new product will address problems related to Big Data and analytics, and will ultimately enhance Wipro's presence in the community-driven world of open source.

"BDRE will not only make Big Data technology adoption simpler and effective, it will also open opportunities across industry verticals that organisations can successfully leverage," said Bhanumurthy B.M., president and CEO, Wipro Limited, in a statement.

California-based Hortonworks considers the new development as a step further to its existing relationship with Wipro. The product is presumed to have over 100 opportunities across industry verticals.

"We are glad to hear that Wipro has open sourced its Big Data and analytics product, BDRE, and taken a stride forward in contributing to the open source community. This step will help us further strengthen our relationship and reinforces our belief in open source technology for the enterprise," said Herb Cunitz, president, Hortonworks.

Wipro plans to use its new open source product for collaborative development to deliver an efficient solution to create operational frameworks for the mass market.

provided a new version of the Docker engine for Windows that has extensive container support and improves the DockerFile syntax. You just need to enable the preloaded Hyper-V feature to use Docker on your Windows 10 machine. This can be done through PowerShell.

Apart from the new Docker compatibility, Microsoft has added Pseudo Terminal support to Windows Subsystem for Linux (WSL) to enable Windows Insiders with an improved Bash on Ubuntu. The operating system also has Tmux support to upgrade the open source-influenced experience.

To extend the presence of Bash on Ubuntu, your Windows 10 machine now comes with a case-sensitive DrvFs. You can also delete or chmod read-only files from DrvFs directly from your desktop. Additionally, there is an optimised command line arg structure that allows you to input an extremely long argument list.

You need to sign up for the Windows Insider programme to download the newly released Windows 10 build. However, the new features will also be publicly released sometime in the near future.

VMware launches Liota open source IoT SDK

American cloud and virtualisation company, VMware, has launched Liota as its first open source software development kit (SDK) for the world of Internet of Things (IoT). The new offering is designed to build a secure IoT gateway for data and control orchestration applications.

Announcing the Liota SDK, VMware SVP and CIO, Bask Iyer, said the new kit enables the libraries to develop applications that connect and orchestrate data and control flows across connected devices, gateways and the cloud. "Liota has been generalised to allow, via modules, interaction with any data centre component, over any transport, and for any IoT gateway," wrote Iyer in a blog post.

VMware's Liota isn't just an open source SDK for IoT devices, but also comes as a vendor-neutral kit to let enterprises manage and leverage multiple gateway vendors within their IoT infrastructure.

"Liota solves an industry problem that's very real and has been validated in many recent discussions I've had, including with some VMware customers who have had early access to the framework," Iyer wrote.

VMware has already tested the operations of Liota on solutions such as VMware AirWatch, VMware vRealise Operations Manager and open source tool Graphite. The kit is written in Python and is available for access through GitHub.
