

Figure 11: *myContact* app output on the emulator

Figure 12: *myContact* app new contact form

Figure 13: *myContact* app output with contacts

Click on the New button shown on the right top corner, which will open the form we created, as shown in Figure 9.

Fill in the data and click on *Create Contact* which will close the form and display the data on the mail application page, as shown in Figure 10.

Let's run it on the emulator. In terminal windows, press *q* to return to the normal prompt and execute the following commands:

```
$ ionic build android
$ ionic emulate android
```

The last command, as usual, will launch the emulator, as shown in Figure 11.

Click on the *New* button and add the data, as shown in Figure 12.

Add some more data in the same way, and we can see all that was added displayed on the main screen (Figure 13).

The Ionic framework has many other UI/UX controls. You can see how easy it is to build an application using Ionic. If you want to run the same application on iOS, install the iOS SDK, replace the Android commands with iOS commands, and our iOS application is ready. For more information, refer to the Ionic website which contains CSS components, books, demos and much more [END](https://ionicframework.com/)
