

Open source BI framework Helical Insight launched in India

Helical IT Solutions has launched 'Helical Insight' in India. The company claims that the new offering is the world's first open source business intelligence (BI) framework that offers built-in functionalities for end users to utilise in-house resources.

Unlike a traditional BI tool that provides basic functions like email scheduling, a multi-tenant environment and visualisation options, Helical Insight comes bundled with some advanced features such as inbuilt workflow and instant BI that are backed by machine learning and artificial intelligence. The product does not occupy space on any particular hardware, as it works as a browser-based tool.

"We have created the world's first open source BI framework that is a powerful tool and an economical solution for companies to leverage data-driven strategies to leapfrog others to become the best-in-class. Helical Insight, being a developer-friendly framework, allows customers to add functionalities at will, wherever required, without depending on the vendor," said Nikhilesh Tiwari, founder, Helical IT Solutions, in a statement.

The API-driven functionality of Helical Insight allows you to expand its presence simply through integrating APIs. The system also gives you an integrated workflow to enable implementation of different functional modules. Features like machine learning and an NLP module provide business users with a direct way to interact with their data, get answers to key questions — all without the need of any third-party support.

Based in Hyderabad, Telangana, sources at Helical IT Solutions say that being open source, Helical Insight has already been 'battle-tested'. Thus, you can check it out right away.

The framework is available free for the first six months. You need to provide your details on the official website to access its functions, on the go.

Microsoft now lets you natively use Docker on Windows 10

Microsoft has released a new update for Windows 10 that allows you to use Linux-based Docker natively on your system. Targeted at developers, the new Windows build also brings some noticeable improvements to Ubuntu Bash.

Windows 10 Insider Preview Build 14361 comes with the Hyper-V container to let you build, ship and run Docker containers. It utilises Windows Server 2016 Technical Preview 5 Nano. Additionally, the Redmond giant has

Mozilla launches US\$ 500,000 fund to make open source secure

With the aim of enhancing security within the open source software world, Mozilla has announced the launch of its Secure Open Source (SOS) Fund. This is part of the Mozilla Open Source Support programme and has initial funding of US\$ 500,000.

Mozilla aims to use the SOS Fund to cover audits of some popular open source libraries and programs. Additionally, it is expecting participation from companies and governments worldwide to take open source security to new levels.

"From Google and Microsoft to the United Nations, open source code is now tightly woven into the fabric of the software that powers the world," Chris Riley, head of public policy, Mozilla, wrote in a blog post. "Indeed, much of the Internet — including the network infrastructure that supports it — runs using open source technologies. As the Internet moves from connecting browsers to connecting devices (cars and medical equipment), software security becomes a life and death consideration," Riley's post went on to add.

Under the new fund, Mozilla will contract with professional security firms to audit project codes. The browser maker will also jointly work with project maintainers to support and implement fixes as well as manage disclosure.

To encourage secure practices to protect open source solutions in the market, the company is set to pay for the remediation work directly through the fund.

Riley says that Mozilla has already tested the newly designed process for securing open source. The company addressed a total of 43 bugs in three different pieces of open source software, indicating the potential scope and success of such a development.

Mozilla's move to launch a special fund to secure open source is certainly vital for the software industry.
