

Expose-style task switch.

“Black Lab Linux 7.6 is the latest release of our stable 7.x series of OSs, and is supported long term until April 2019,” said CEO Robert J. Dohnert. To deliver a secure computing experience for all the open source enthusiasts and developers, the new Ubuntu-based Linux distro comes with all the security patches and software updates that have been released as of April 18, this year. Users may have already experienced these in the Ubuntu 14.04 LTS ‘Trusted Tahr’ version.

Black Lab Linux 7.6 can be installed on your system if it has at least 512MB of RAM, 8GB disk space and a graphic card with 800×600 pixels resolution. You can boot the 64-bit variant of the new Black Lab Linux either on UEFI or BIOS devices, while its 32-bit version is designed exclusively for BIOS devices.

The team behind Black Lab Linux acknowledges that some NVIDIA GeForce graphic cards aren’t fully compatible with the open source driver provided by the new kernel. Also, you would face issues while installing the new custom distro on virtual machine set-ups as they often restrict boot in live mode. In such cases, it is recommended that users boot the release into the direct installer from the boot menu.

You can download the 32-bit and 64-bit versions of Black Lab Linux 7.6 directly from the Ibiblio website. If you already have a Black Lab Linux 7.0.x version, you can install the latest one simply by enabling the distribution update option.

Red Hat plans cloud based future with OpenStack Platform 8

After shifting its focus from Red Hat Enterprise Linux, Red Hat has now announced the general availability of Red Hat Cloud Suite and OpenStack Platform 8 to grow its presence in the emerging world of cloud solutions. The new offerings aim “...to help in bridging the gap between development and operations teams” right at the cloud computing scale.

OpenStack isn’t new for Red Hat. But with the latest announcement, the open source software company will have an upgraded version of its scalable infrastructure along with all-new optimised storage and management capabilities. There will be Red Hat Ceph Storage and Red Hat CloudForms to natively enable the new features.

While Red Hat OpenStack Platform 8 will offer a new Infrastructure-as-a-Service (IaaS) platform to enterprise customers, Red Hat has an integrated hybrid cloud stack with a container application platform in the form of OpenShift to

Ubuntu 12.04 LTS gets major kernel update

Canonical has released a major new kernel update for Ubuntu 12.04 LTS (Precise Pangolin) operating system. The new update patches 19 vulnerabilities within the Linux kernel of Ubuntu’s Precise Pangolin build.

Ubuntu Security Notice USB-2967-1 reveals the new kernel update. It comes under version linux-image-3.2.0-102 (3.2.0-102.142) and is designed for hardware architectures such as 64-bit, 32-bit, PowerPC (PPC) and ARM OMAP HighBank as well as ARM OMAP.

Although the Ubuntu 12.04 LTS was originally released in April 2012, Canonical keeps on supporting the Long Term Support version. It was the first Ubuntu release to receive official support for five years.

You can install the new kernel update on your Ubuntu 12.04 LTS running system directly through the Unity Dash. Simply search for the ‘Software Update’ utility and then click the ‘Install All’ button to apply all the patches to your system. Then reboot your system to apply the update.
