or sync can be done with the server.

Click on **Schedule**. A new pop-up window is generated with a number of options.

Setting up an anti-virus engine with OPNsense

OPNsense provides the excellent and powerful standard ICAP (Internet Content Adaptation Protocol) for protection of HTTP as well as HTTPS traffic connections against assorted malware including trojans, botnets, malware, viruses and many others. It has an effective communication layer with third party engines including the Symantec Protection Engine.

After selecting the anti-malware engine, configuration is required. To encrypt the traffic with ICAP, there is a need to implement VLAN because the traffic in ICAP is not encrypted by default.

To configure ICAP, the navigation is **Services->Proxy->Administration**. Then select **ICAP Settings** for the **Forward Proxy** tab.
