

Click *Statistics* → *I/O graphs*. For example, you can plot a graph for a certain device with a particular IP address, `ip.addr==192.168.1.1`. Multiple filters can be put and their corresponding I/O graphs can be studied simultaneously in the same plane.

In I/O graphs, X-axis denotes the time that has passed since the capture of the packet. Y-axis denotes the number of packets captured per unit of time. This unit of time can be selected using *Tick interval* on the left-hand side of the screen.

If you click on the graph, the Wireshark window will move in the background to the corresponding data. The graph can be saved as .png, .jpeg and other formats by clicking *Save*.

Similarly, we can use Wireshark in a number of ways to study communication data and draw important conclusions.

Note: 1. Working with a busy network can easily result in huge memory and disk space usage. So you need a machine with a fast processor, large memory and disk space. If Wireshark runs out of memory, it will crash. For silent installation and working, go for the command-line version.
2. With Wireshark, it is easy to troubleshoot the devices and make these work in a much better way.

What Wireshark is *not*

Wireshark is not an intrusion-detection system. It will not warn you when people do strange things on your network that they are not allowed to do. However, if strange things happen, Wireshark might help you figure out what really is going on. It is like a monitoring device.

Wireshark will not manipulate things on the network; it will only measure things from it. It does not send packets on the network or do other active things.
