

A hard link can be created by typing the following command:

```
[bhargab@localhost~]$ln file1 file2
```

And a soft link by typing the following command:

```
[bhargab@localhost~]$ln -s file1 file3
```

Change Mod

In Linux, every file is associated with three types of permissions—read (r), write (w), and execute (x). The existing file permission can be changed by the owner of the file or the super user. The following command will embed a write permission to the group:

```
[bhargab@localhost~]$chmod g+w file1
```

Similarly, to give an execute permission to other users, use the command given below:

```
[bhargab@localhost~]$chmod o+x file1
```

In order to take away execute permissions from a group, type the following command:

```
[bhargab@localhost~]$chmod g-x file1
```

Current working directory

The `pwd` command displays the current working directory, as follows:

```
[bhargab@localhost~]$pwd
```

```
/home/bhargab
```

This means that the current working directory is `/home/bhargab/`.

Creating a directory

The `mkdir` command is used to create a directory, as follows:

```
[bhargab@localhost~]$mkdir myDir
```

This will create a directory, `myDir`, under `/home/bhargab/`.

Removing a directory

The `rmdir` command is used to remove an empty directory, as shown below:

```
[bhargab@localhost~]$rmdir myDir
```

`rmdir` with the `-p` option removes not only the specified directory but also parent directories.

```
[bhargab@localhost~]$rmdir -p myDir
```

In the next article, we'll cover topics like user account management, process management, and more.
