

The Basic Elements of AngularJS

Here is an introductory article to AngularJS, a very powerful JavaScript framework. It can be added to an HTML page with a `<script>` tag. Read on to know and understand more about its features.

AngularJS is a JavaScript framework that allows you to extend HTML into a more readable and presentable format. It enables you to write your application logic instead of manually updating views. AngularJS helps to write cleaner and more efficient code for creating rich and interactive single page applications (SPAs).

The general features of AngularJS are shown in Figure 1.

Why AngularJS?

A single page application is one that has a shell page and contains multiple views in the page. The challenge with building single page applications from scratch is that there are a lot of different issues to deal with, as shown in Figure 2.

AngularJS provides solutions to all these challenges. It is a full-featured SPA framework. Some of the core features are described in Figure 3.

A 'Hello World' example

First, all we have to do is include Angular JS JavaScript in our

HTML document, as follows:

```

<!doctype html>
<html ng-app>
<head>
<script src="https://ajax.googleapis.com/ajax/libs/angularjs/1.5.3/angular.min.js"></script>
</head>
<body>
<div>
<label>Name:</label>
<input type="text" ng-model="yourName" placeholder="Enter a name here">
<hr>
<h1>Hello {{yourName}}!</h1>
</div>
</body>
</html>

```
