

```
"abc");});
testModule.controller("MyController", function($scope,
testFactory) {
    console.log(testFactory);
});
```

Service

A service is a singleton JavaScript object, which is a set of functions to achieve specific tasks. The functions contain the necessary logic for the service to carry out its tasks. They are defined using *service()* functions and then used in controllers.

```
TestModule.service("testService".MyService)
```

MyService is nothing but a function.

Providers

Providers in AngularJS are the most flexible, and are used to create services, factories, etc. You can register a provider with a module just like you handle a service or factory, except that you must use the *provider()* function instead.

Constants

Constants are used to pass values during the *config* phase by taking into consideration the fact that the value cannot be

passed during this phase. Constants in AngularJS are defined using the *module.constants()* function. Shown below is an example of an AngularJS constant:

```
testModule.constant("configValue"."constant config value")
```
