

Caja Actions

The introduction of GNOME 3 broke many GNOME 2 applications. The most affected was the file and desktop manager, Nautilus. Hence, the Mate desktop uses Caja, a fork of the old Nautilus program. Nautilus had an extension manager named Nautilus Actions Configurations. For Caja, there is Caja Actions, a fork of Nautilus Actions Configuration.

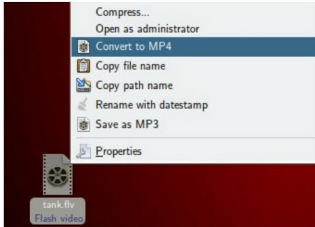

Figure 4: Caja Actions menu

The following steps allow you to compile and build Caja Actions:

```
sudo apt-get install checkinstall xclip xsel yelp-tools
libglb2.0-dev descriptrs build-essential libgtk2.0-dev
libunique-dev libgtop2-dev libgtop2-7 libxml2-dev uuid-dev
libcja-extension libcja-extension-dev docbook-utils
mkdir build-caja-actions
cd build-caja-actions
git clone git://github.com/raveit65/caja-actions.git
cd caja-actions/
NOCONFIGURE=1 ./autogen.sh
./configure --with-gtk=2 --enable-html-manuals
sudo make
sudo checkinstall --install=no
```

These steps create a DEB file. Run it to install Caja Actions. If, after this, an option for 'Caja-Actions Configuration Tool' does not appear under the 'System -> Preferences' menu, then create one manually with the command `caja-actions-config-tool`.

After launching this app, you can create your own context menu options for files and directories. These custom menu options can be made to run commands, scripts and programs. Here are a few scripts to get you started:

- Copy path name
 - Use parameter as %f
 - Use command as below

```
printf "%1" | xclip -selection "clipboard"
notify-send "%1"
```

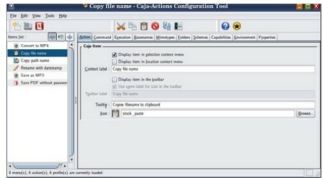

Figure 5: Caja Actions configuration tool

- Copy file name
 - Use parameter as %b
 - Use the same command as used for 'Copy path name'
- Convert to MP4 for playing with consumer electronic devices
 - Use parameter as %f
 - In the *Basenames* tab use filters for *.3gp, *.avi, *.flv, *.mov, *.mpeg, *.mpg, *.ogv, *.vob, *.webm, *.wmv
 - In the *Execution* tab use mode as terminal
 - In the *command* tab use the code given below

```
sBaseName=$(basename "$1")
sOutputFileName=~ /Desktop/${sBaseName%.*}.mp4
ffmpeg -i "$1" -f mp4 -qscale 0 "$sOutputFileName"
notify-send "Saved as $sOutputFileName"
```

- Save as MP3 (remove video from a media file so that you can listen to it in an audio player)
 - Use parameters as %d and %f
 - Basename filters for *.3gp, *.avi, *.flv, *.mov, *.mp4, *.mpeg, *.mpg, *.ogv, *.vob, *.webm, *.wmv
 - In the *Execution* tab use mode as terminal
 - In the *command* tab use the code given below

```
sInputFile=$1/$2
sOutputFileName=$(basename "$sInputFile")
sOutputFileName=~ /Desktop/${sOutputFileName%.*}.mp3
ffmpeg -i "$sInputFile" -vn -aq 0 "$sOutputFileName"
notify-send "Saved as $sOutputFileName"
```

- Rename with timestamp - useful for archiving
 - Use parameters as %d and %b
 - Basename filter for *.pdf
 - In the *Execution* tab use mode as terminal
 - In the *command* tab use the code given below

```
sBaseName=$(basename "$2")
sExtension="${sBaseName%.*}"
sFileName="${sBaseName%.*}"
sTimestamp=$(date --reference=$1/$2 +%Y-%m-%d_%H-%M-%S)
if [ "$sFileName" = "$sExtension" ]
```
