

SQLyog: This is a database management application on Windows and Linux.

Here is a short list of applications that officially support MariaDB:

- Drupal
- Moodle
- Wordpress
- ERP5
- MONyog
- Kajona

These, apart from many more, are a proof that MariaDB is accepted across the industry and is a force to reckon with in the world of RDBMS.

Developers' section

As the article is about a new and rapidly developing RDBMS, it obviously opens up a sea of opportunities at every possible stage, for everyone to contribute and be a part of the change.

If you are an enthusiast, love the open source culture and, most importantly, want to make a name for yourself with some effort, given below are a few links that can help you do exactly that.

- MariaDB Launchpad: <https://launchpad.net/~maria-developers>
- IRC Channel: <irc://irc.freenode.net/maria-meeting>
- MariaDB Bug Database: <https://mariadb.com/kb/en/mariadb/reporting-bugs/>
- MariaDB Knowledge Base: <https://mariadb.com/kb>

Analysing The Grinder data

The Grinder is a tool that is made for developers. It generates raw data, which is not very user friendly. Once Grinder collects the data for you, you can do whatever you want to do with that data. For a quick overview of your data, you can use a tool called GrinderAnalyzer.

The Grinder is a pretty powerful and flexible performance testing tool. I hope that after this tutorial you will have the knowledge to install and set up The Grinder for testing your application.

For more information, please refer to the Grinder documentation available on The Grinder website.
