3. Now you need to get this *apk* file to your mobile phone either via Bluetooth or via USB cable. Once you have placed the *apk* file to your SD card, you need to install it. Follow the on-screen instructions to install it. You might get a warning stating that the installation is from an untrusted source. Allow this from the settings and, after successful installation, you will see the icon of your application in the menu of your mobile. Here, you will see the default icon that can be changed, which we will tell you how to do as we move ahead in this course.

I hope your application is working exactly as per your requirements. Now, depending upon your usability and customisation, you can change various things like the image, sound and behaviour, too.

Debugging the application

We have just created the prototype of the application with very basic functionality. What else might the user be interested in? Let's look at various possible cases that require serious care so as not to annoy the user. Consider the following.

1. Wouldn't it be nice to add some background music for the game as well?
2. Rather than starting the game automatically, can we have a control button that needs to be pressed for the game to begin?
3. Can we move the two paddles independently, i.e., with some sort of procedure or method to give it artificial intelligence?

These are some of the scenarios that might occur and users will be pretty happy seeing those implemented.

Think through all these scenarios and how you can integrate these into the application. Do ask me if you fail to accomplish any of the above cases.

You have successfully built another useful Android app for yourself. Happy inventing 

2. The progress of the download will be shown and after successful completion, the application will be placed in the download folder of your directory or the location you have set for it.
