NASSCOM and Symantec jointly launch cyber security courseware in India

The National Association of Software and Services Companies (NASSCOM) has announced its partnership with the Data Security Council of India (DSCI) and Symantec to launch new cyber security courseware in the country, which brings 10 cyber security job roles under the National Occupational Standards.

In addition to the new courseware, NASSCOM has also launched Qualification Packs (QP) for organisations in the IT/ITeS, financial and consultancy advisory fields.

"This initiative has a two-pronged approach — it contributes to containing the spurt in cyber crimes and also enhances the employability of the workforce," said R. Chandrashekar, president, NASSCOM, in a statement.

"Building the next generation of cyber professionals is key to securing India's critical information infrastructure, battling cyber crime and making the 'Digital India' initiative successful. Leading on from our commitment in 2015, we continue to work closely with NASSCOM to build a cadre of world-class, skilled and certified cyber security professionals in India, with a special focus on youth and women," said Sanjay Rohatgi, SVP—Asia-Pacific and Japan, Symantec.

While the new courseware is considered to be helpful for all sectors, the open source area would get a major boost through this new development.

Speaking to the *Open Source For You* team on the sidelines of the courseware launch in New Delhi, Chandrashekar revealed, "We should ensure that security threats in the open source area are also covered in the training programme. For some time, there was a perception that this is only a problem of proprietary software, but experience has shown that the problem is very much there for open source software too."

Microsoft releases Visual Studio Code 1.0

Microsoft has released Visual Studio Code 1.0. This new version is the latest upgrade to the open source code editor and debugger that the Redmond company launched in April last year.

Visual Studio Code was debuted to help developers with new editing and debugging tools. While the initial build of the editor was not available as an open source offering, it received a new update last November that made its source code public.

Microsoft claims that since the release of its public preview in May last year, Visual Studio Code has been installed by more than two million developers.

Windows 10 integrates Bash to let you run Linux programs

Microsoft has released a new Windows 10 build that allows you to run your favourite Linux programs directly through the Bash command line.

Windows 10 build 14316 provides you a native way to work on Bash. This comes as a result of the partnership that the Redmond giant announced with Ubuntu maker Canonical at its Build 2016 developer conference recently.

As you might be aware, Bash is a UNIX shell that already existed on Linux based platforms. But Microsoft has developed a Windows Subsystem for Linux (WSL) to let you run a genuine Ubuntu user-mode image on your Windows 10 device. "Based on your feedback, we've done a couple of things. First, we made investments that improve cmd, PowerShell, and many other command line tools and developer scenarios. Second, we decided to grow our command line family by adding real, native Bash and with it, support for Linux command line tools which run directly on Windows in an environment that behaves like Linux," said Mike Harsh, principal group program manager at Microsoft, in a blog post.

To enable the Bash command line on your updated Windows 10 build, you need to enable 'Windows Subsystem for Linux (Beta)' by choosing the 'On' or 'Off' options from the 'Windows Features' menu.

In addition to Linux programs, you can use the new feature to run Bash scripts and use Linux-first tools such as Ruby, Git and Python, among others. Microsoft also lets you access your Windows file system directly from Bash.

Even though Bash is now just within your Windows 10 system, there are still some gaps. You would not be able to run all your Bash scripts. Additionally, you will not be allowed to transform your Windows device into a server platform to host websites.

Despite having some drawbacks in these initial stages, the Windows 10 build 14316 finally sets a new pitch for software developers. It gives an open source-like experience on the latest Windows platform. Moreover, it gives you a new reason to use Windows as your primary operating system.
