

Figure 1: Choosing the language in Drupal

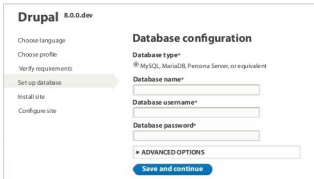

Figure 2: Database configuration

A clean URL is an issue that has challenged me quite often. But, what is a clean URL? If you ignore this issue and go ahead with the installation, Drupal will get installed in your system. But, when you start using it, you will understand there is a bit of a problem. Because, when you click on any link in the home page, you will get a 'Page not found' message. However, when I added *index.php* soon after Drupal in the URL, i.e., *localhost/Drupal8/Drupal/index.php/something*, I could reach the required link. But, as you all know, it is tedious to add *index.php* every time. So the small fix that I found for this issue is as follows:

```
$sudo a2enmod rewrite
```

Open your Apache file

```
$sudo gedit /etc/apache2/apache2.conf
```

Usually, the localhost will be in */var/www/html*, so add the following lines at the bottom of the Apache file

```
<Directory /var/www/html/*>
    AllowOverride All
</Directory>
AccessFileName .htaccess
```

Now, restart the Apache server

```
$sudo service apache2 restart
```

Now, refresh the *Requirements* page and the issue will be fixed.

Once all the basic requirements are satisfied, you need to take some other small steps. You need to create a directory called *sites/default/files* as follows:

```
$mkdir sites/default/fileshttps://www.Drupal.org/project/project_theme
```

Now, make the directory writeable by using the following command:

```
$chmod a+w sites/default/files
```

Next, create a new file *sites/default/settings.php* and copy the contents from *sites/default/default.settings.php* to the new file, as follows:

```
$cp sites/default/default.settings.php sites/default/settings.php
```

Now, make the file created writeable by the code shown below:

```
$cp sites/default/default.settings.php sites/default/settings.php
```

Once you are done with all the requirements, you will be guided to the database configuration page.

Go to your *phpmyadmin*. Open a new tab and go to *localhost/phpmyadmin*.

Log in with your user credentials. Click on *Database* and under *Create database*, enter any database name and click on *Create*. You will see the new database created in the database list.

Now go back to the installation page. Enter the database you have created. Also add your database user name and password. Once you are done, click on *Save and Continue*.

Once the database details you have entered are verified, the Drupal installation begins. I hope you are able to see something like what's shown in Figure 3.

It may take a couple of minutes to complete. When the installation ends, start configuring your sites. Add a stylish site name, give a site email address and fill all the fields as per the instructions on the page.

You have now built a Drupal site and should see something like what's shown in Figure 4.
