

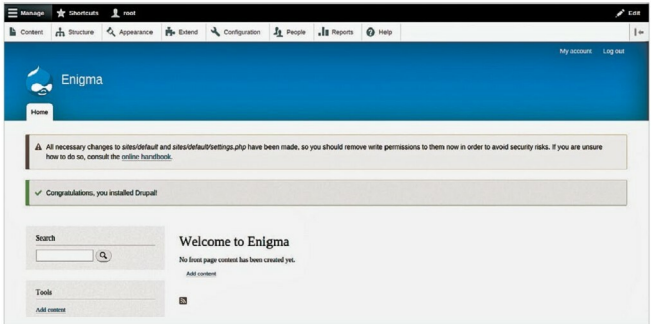

Figure 4: Drupal website

You can go through the various links and start exploring and experiencing Drupal. I am sure you have enjoyed this installation, which hasn't taken long.

If you go to *Appearance*, you can change the theme. You can either select themes from the given options or install one from https://www.Drupal.org/project/project_theme. Copy the address of the tar file that you would like to install. Select *Install new theme* in *Appearance*. Paste the link and click on *Install* for the new theme to get installed.

Find and fix bugs

You can start contributing to open source projects by fixing some bugs in the Drupal core. Create an account in <https://www.Drupal.org>. There is an issue queue in Drupal, where you can see all the bugs reported. Visit <https://www.Drupal.org/project/issues/Drupal>. You should see something like what's shown in Figure 5.

This list consists of all the issues or bugs of Drupal. It gives a brief summary of all the issues.

You can add filters and choose issues as per your requirement. If you want to start working on any bug, it's better to change the status field's value in the filter to *Active*. This will show up all the bugs you can start with. Open issues will contain the list of all issues — those under review, those that have been fixed and also those that are yet to be worked upon.

Since we have installed a particular version of Drupal (8.0.x), change the version to 8.0.x-dev. You can select the priority as per your wish. Now, search for issues. If you find one that you can solve, open the issue. Read the report about it given in the issue link. The comments may be really useful. Go through them and once you think you

can work on it, click on *Update this issue*. On the *Assigned* option, choose your user name (I hope you are logged in to your account) and click on *Save*. This ensures that you are working on this issue.

Now, make the required changes in the code and test it locally.

Submitting a patch

Once you are done with the required changes, we need to upload it to the issue queue. Drupal generally accepts Git diffs, i.e., you need to upload only the patch.

So, get the Git diff. Go to your Drupal Git repo in your system and do a Git diff. There is a format for the file in which the diff should be stored. It is of the form:

```
bugId-short_description_of_the_comment-new_comment_number.patch
```

Give a very short description of the comment. 'New Comment Number' is the comment to which the patch is supposed to get attached, which can be seen on the issue page.

So, the Git diff will be of the form:

```
git diff 8.0.x > bugId-short_description_of_the_comment-new_comment_number.patch
```

Once you have stored the patch file, we need to upload it to get it reviewed. Go to the issue link and then to the bottom of the page. You will see the *Add a new file* option. Upload the patch and click on *Save*. Now, click on *Update this issue* and change the status to *Needs review*. The patch you have uploaded is now ready to get reviewed. The patch also undergoes some basic tests, which will check the coding
