

Figure 1: Login page with social sign-on integration

The following is a classical sign-in script:

```
<?php
session_start();
$myconfig = 'mylib/config.php';
require_once( 'mylib/Hybrid/Auth.php' );
try{
    $myhybridauth = new Hybrid_Auth( $myconfig );
    $mytwitter = $myhybridauth->authenticate( "Twitter" );

    $mytwitter_user_profile = $mytwitter->getUserProfile();

    echo "Connection Successful -> <b>{$mytwitter->id}</b>";
<br />";
    echo "As: <b>{$mytwitter_user_profile->displayName}</b>";
<br />";
    echo "User Identifier <b>{$mytwitter_user_profile->identifier}</b>";
<br />";

    print_r( $mytwitter_user_profile );

    $myaccountsettings = $mytwitter->api()->get( 'account/
settings.json' );

    echo "Twitter Account Settings " . print_r(
$myaccountsettings, true );

    echo "Logging out..";
    $mytwitter->logout();
}
catch( Exception $myexception ){
    switch( $myexception->getCode() ){
        case 0 : echo "Unspecified error"; break;
        case 1 : echo "Configuration error"; break;
        case 2 : echo "Provider not configured"; break;
        case 3 : echo "Unknown provider"; break;
        case 4 : echo "Application credentials not found";
break;
        case 5 : echo "Authentication failed. ";
break;
        case 6 : echo "User profile not found"
$mytwitter->logout();
```

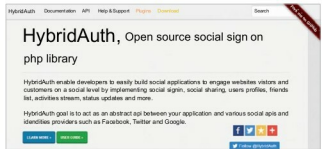

Figure 2: HybridAuth website for social login integration

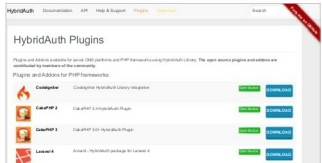

Figure 3: Plugins download and integration page of HybridAuth

```
break;
case 7 : echo "User not connected";
$mytwitter->logout();
break;
case 8 : echo "Provider does not support this
feature."; break;
}
echo "<br /><br /><b>Original error message:</b> " .
$e->getMessage();
}
```

Fetching a user profile using HybridAuth

To fetch a user profile using HybridAuth, type the following code:

```
$myhybridauth = new Hybrid_Auth( $myconfig );
$myadapter = $myhybridauth->authenticate( "Twitter" );
$myuser_profile = $myadapter->getUserProfile();
echo "Hello " . $myuser_profile->displayName;
```

The following parameters/fields of the user profile can be fetched by using the Hybrid User Profile Object:

profileURL	webSiteURL	photoURL
displayName	description	firstName
lastName	gender	language
age	birthDay	birthMonth
birthYear	email	emailVerified
phone	address	country
region	city	zip
