

NMap

Figure 6: NMap – A Web security and network discovery tool

NMap (Network Mapper) is a free and open source tool to test Web security and network discovery. It can be installed on

Linux, Microsoft Windows, BSD variants like Mac OS X, AmigaOS, Solaris, HP-UX, and the SGI IRIX operating system. NMap uses raw IP packets in novel ways to determine what hosts are available on the network, what services (application name and version) those hosts are offering, what operating systems (and OS versions) they are running, what type of packet filters/firewalls are in use, and dozens of other characteristics. It was designed to rapidly scan large networks, but works fine against single hosts.

Sahi

Sahi is one of the popular Web automation

Figure 7: Sahi - The tester's Web automation tool

testing tools. It is free and open source, apart from offering a commercial version with an advanced feature set.

This tool is written in Java and JavaScript and has been released under Apache License 2.0.

The Sahi open source version includes the following feature set that is sufficient for most testing purposes.

- Records on all browsers
- Plays back on all browsers
- HTML playback reports
- JUnit style playback reports
- Suites and batch run
- Parallel playback of tests

Wapiti

Wapiti is a Web security auditing tool that allows you to test the vulnerability of your

Figure 8: Wapiti – A Web security auditing tool

of the deployed Web app looking for the scripts and forms where it can inject data.

Wapiti supports both GET and POST HTTP methods. It also supports multipart and can inject payloads in file names (upload). It displays a warning when an error is found (for example, 500 errors and timeouts). It can identify permanent and reflected XSS vulnerabilities.

Wapiti can detect the following vulnerabilities:

- File disclosure
- Database injection
- XSS
- Command execution detection
- CRLF injection (HTTP response splitting, session fixation, etc)
- XXE (XmlExternal Entity) injection
- Use of known and potentially dangerous files
- Weak .htaccess configurations that can be bypassed
- Presence of backup files giving sensitive information (source code disclosure)

Siege

Siege is a simple load testing and benchmarking tool. It supports GET and

POST methods to test your Web servers through cookies, HTTP, HTTPS and FTP protocols. You can test single or multiple Web URLs in a single test. Siege is designed to let Web developers measure their code during high traffic, to see how it handles the load on the Internet.

Browsershots

Browsershots is a free, open source, online cross-browser testing utility. It allows you to test website browser compatibility from a single place, and makes screenshots of your Web design in different operating systems and browsers. When you enter any Web URL in Browsershots to test it, it will be added to the job queue and your website will be evaluated on all the selected browsers on their servers. Once this processing has been done, your test results' screenshots will be uploaded to the central dedicated server.

Supported browsers are Firefox, Google Chrome, Opera, Safari, Minefield, Arora, Dillo, Rekonq, Midori, Konqueror, Iceweasel, Iceape, Lynx and MSIE.

IE NetRenderer

IE NetRenderer is a utility to test your website's browser compatibility in different versions of Internet Explorer. Supported IE versions are 11, 10, 9, 8, 7, 6 or 5.5. This online tool is similar to Browsershots; you just need to enter your Web URL on IE NetRenderer and it will display the consolidated results on the same screen.
