

```
app.run(debug=True)
```

The following line in *setup.py* is for installing dependencies for Flask:

```
# install_requires=[],
```

Replace the above line with the following:

```
install_requires=['Flask==0.7.2', 'MarkupSafe'],
```

Now, commit your changes and push the changes to OpenShift:

```
# git add .
# git commit -m "Initial commit for FlaskDemo app"
# git push origin master
```

Once you are done with pushing the changes, look for error messages in the Git push command. If there are no errors, head to <http://flaskdemo-{domain-name}.rhcloud.com/>. Replace the domain name with the domain name

you provided. Your Flask application will be hosted on this URL.

In this article, we have looked at how to create an OpenShift application and deploy a Flask application on it.

If you are interested in deploying a blog or Web application, then you can check out OpenShift. If you want to contribute to the development of OpenShift itself, check the open source project OpenShift Origin, which is the official upstream source for OpenShift. You can read the guidelines for contribution at <https://blog.openshift.com/how-to-contribute-code-to-openshift-origin-paas/>. **END**
