

What's Hot in Open Source Web Development

Advances in the computer world occur very swiftly. This article keeps the reader abreast of what is hot and trending in open source Web development. The author has chosen 10 open source tools and practices to create awareness about them.

The field of Web development is constantly changing with new frameworks, tools and best practices being used to develop any website. Since it's difficult to consider all that's hot in Web development tools and technologies here, I've put together 10 unique open source tools and practices that are trending today.

The Internet of Things (IoT)

The Internet of Things (IoT) is one of the hot technologies currently. According to Technavio (a tech-focused research firm), the global IoT market is expected to grow at a CAGR of 31.72 per cent from 2014 to 2019.

The IoT is the network of physical objects – gadgets, devices, consumer durables, cars and trucks, industrial and utility components, sensors, and other everyday objects - that are embedded with electronics, software, sensors and network connectivity, enabling them to

generate, exchange and consume data. The IoT allows objects to be controlled and sensed remotely. As more devices are being connected and made network accessible, Web developers will have to come up with new solutions to help users control and communicate with their everyday gadgets and equipment.

Motion UI

MotionUI is a Sass library for creating flexible UI transitions and animations. Developed by the folks at ZURB, it's widely used for creating animation and CSS transitions easily. It's now a standalone library that powers the transition effects used in a number of Foundation components, including Toggler, Reveal and Orbit. Motion UI has more than two dozen built-in transition classes. You can also create custom transition classes using Motion UI's mix-in library.
