

DVD OF THE MONTH

Try out these professional and user-friendly Linux distros.

Manjaro XFCE Edition (16.08)

Manjaro is a user-friendly Linux distribution based on the independently developed Arch operating system. The bundled live DVD can also be installed on your computer. In the live DVD mode, you can try Manjaro with the Xfce desktop environment. Xfce is a lightweight desktop environment for UNIX-like operating systems. It aims to be fast and consumes less system resources, while still being visually appealing and user-friendly.

OpenMandriva Lx 3

OpenMandriva Linux is a full-featured Linux desktop and server. It is based on ROSA, a Russian Linux distribution project which forked Mandriva Linux in 2012. OpenMandriva Lx is a cutting-edge distribution compiled with LLVM/clang, combined with the high level of optimisation used for both code and linking. It has the latest release of all the KDE apps to support the desktop and give you a consistent feel. You can find the live, bootable ISO images available in the *other_isos* folder on the root of the DVD.

Remix OS

Remix OS began as a vision for a world in which the boundaries between mobiles and PCs would forever be eliminated. If you already use Android, you'll love what you can do with Remix OS. To experience it on your PC, all you need to do is extract the zip file available in the *other_isos* folder on the root of the DVD. After extracting it, follow the instructions available in the file *How_to_launch_Remix_OS_for_PC.txt*

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software. Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation. To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.

To use the image available in the *other_isos* folder, you need a drive that can create or 'burn' DVDs, or a USB flash drive at least as big as the image. You could also use it directly with any virtualisation software like VirtualBox.
