

One way to test our service is via the popular Curl utility as shown below. The output is what is echoed back by the service.

```
$ curl $(minikube service hello-minikube --url)
CLIENT VALUES:
client_address=172.17.0.1
command=GET
real path=/
query=nil
request_version=1.1
request_uri=http://192.168.99.100:8080/

SERVER VALUES:
server_version=nginx: 1.10.0 - lua: 10001

HEADERS RECEIVED:
accept=text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,*/*;q=0.8
accept-encoding=gzip, deflate, sdch
accept-language=en-us,en;q=0.8
connection=keep-alive
host=192.168.99.100:31499
user-agent=curl/7.30.0
BODY:
-no body in request-
```

```
SERVER VALUES:
server_version=nginx: 1.10.0 - lua: 10001
```

```
HEADERS RECEIVED:
accept=/*
host=192.168.99.100:31499
user-agent=curl/7.30.0
BODY:
-no body in request-
```

Alternatively, you could also invoke it via the following:

```
$minikube service hello-minikube
```

This will open up the browser at the URL, and you should be able to see the echo service as shown in Figure 2.

You can view the Kubernetes dashboard by using the following command:

```
$ minikube dashboard
```

This will open up the dashboard in a browser, as shown in Figure 3. You can manage the deployment, services, pods and also click on them to view the details.

To clear up the resources, you can use the `kubectl delete` command as shown below:

```
$ kubectl delete service,deployment hello-minikube
service "hello-minikube" deleted
deployment "hello-minikube" deleted
```

Figure 2: Echo server

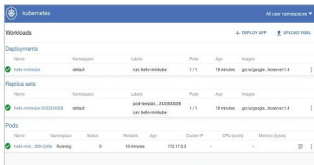

Figure 3: Kubernetes dashboard

Minikube is a great way to get familiar with Kubernetes, and the fact that it is available as a self-contained application on common operating systems makes it a good tool to start with. **END**
