configured while installing the LAMP server.

Click on the *Finish setup* button to create the admin user and log in. A splash screen with the words, 'A safe home for all your data' should appear.

Close the splash screen to access the main interface. Here, you can create or upload files to your personal cloud. Share files with others, view the files shared with you and share files via links.

Extending ownCloud with apps

ownCloud has a rich ecosystem of apps, which provide access to a variety of functionality. Usually, an app offers a distinct function like a mail client or music player, but even core functionalities of ownCloud, like sharing and external storage, are implemented as apps. A large selection of apps is available at apps.owncloud.com and if you want to install one that is not available in the app manager, you can download it from the app store and install it by hand (this process is manual because there is a risk associated with

downloading and running code from the Internet).

Open the *Apps* menu by clicking the drop-down menu at the top left corner near the logo.

You will see which apps are enabled, not enabled and recommended. You'll also see additional filters, such as *Multimedia*, *Productivity* and *Tools* for finding more apps quickly. Add the app that you want by clicking the *Enable* button.
