

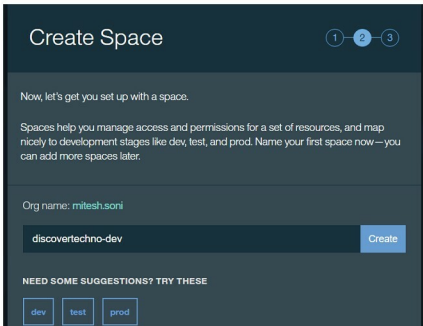

Figure 4: Setting up Space in IBM Bluemix

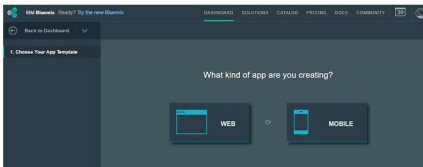

Figure 5: The app template

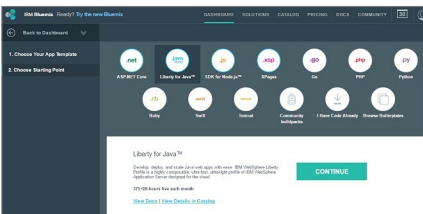

Figure 6: IBM Bluemix supported programming languages

programming languages:

- Java
- Python
- Ruby on Rails
- PHP

▪ Node.js

It also supports OpenWhisk (Function as a Service), which is also an IBM product that allows developers to call any function without requiring any resource management.

How IBM Bluemix works

Bluemix is built on top of IBM's SoftLayer IaaS (Infrastructure as a Service). It uses Cloud Foundry as an open source PaaS. It starts by pushing code through Cloud Foundry, which plays the role of combining the code and suitable runtime environment based on the programming language in which the application is written. IBM services, third party services or community built services can be used for different functionalities. Secure connectors can be used to connect to on-premise systems and the cloud.

Creating an app in Bluemix

In this article, we will create a sample 'Hello World' application in IBM Bluemix by using the Liberty for Java starter pack, in just a few simple steps.

1. Go to <https://console.ng.bluemix.net/registration/>.
2. Confirm the Bluemix account.
3. Click on the confirmation link in the mail to complete the sign up process.
4. Give your email ID and click on *Continue* to log in.
5. Enter the password and click on *Log in*.
6. Set up and *Environment* share resources in specific regions.
7. Create Space to manage access and roll-back in Bluemix. We can map Spaces to development stages such as dev, test, uat, pre-prod and prod.
8. Once this initial configuration is completed, click on *I'm ready. Good to Go!*
9. Verify the IBM Bluemix dashboard after successfully logging in, specifically sections such as Cloud Foundry Apps where 2GB is available and Virtual Server where 0 instances are available, as of now.
10. Click on *Create app*. Choose the template for app creation. In our case, we will go for a Web app.
11. How do you get started? Click on Liberty for Java, and then verify the description.
12. Click on *Continue*.
13. What do you want to name your new app? For this article, let's
