use *osfy-blumix-tutorial* and click on *Finish*.

14. It will take some time to create resources and to host an application on Bluemix.
15. In a few minutes, your app will be up and running. Note the URL of the application.
16. Visit the application's URL <http://osfy-blumix-tutorial.au-syd.mybluemix.net/>. Bingo, our first Java application is up and running on IBM Bluemix.
17. To verify the source code, click on *Files* and navigate to different files and folders in the portal.
18. The *Logs* section provides all the activity logs, starting from the application's creation.
19. The *Environment Variables* section provides details on all the environment variables of VCAP_Services as well as those that are user defined.
20. To verify the application's consumption of resources, go to the *Liberty for Java* section.
21. The *Overview* section of each application contains details regarding resources, the application's health, and activity logs, by default.
22. Open Eclipse, go to the *Help* menu and click on *Eclipse Marketplace*.
23. Find *IBM Eclipse tools for Bluemix* and click on *Install*.
24. Confirm the selected features and install them in Eclipse.
25. Download the application starter code. Import it into Eclipse by clicking on *File Menu*, select *Import Existing Projects into Workspace* and start modifying the existing code.

Why IBM Bluemix?

Here are some compelling reasons to use IBM Bluemix:

- Supports multiple languages and platforms
- Free trial
 - Minimal registration process
 - No credit card required
 - 30-days trial period – with quotas of 2GB of runtime, 20
