

Figure 1: Firebase dashboard

Figure 3: Demo project in the Firebase dashboard

Figure 4: Reading and writing rules with authentication

Figure 5: Rules with read and write permission

an empty space for your project in the Firebase database, and have given read and write permissions to all the users who have the URL.

If you are new to this Android journey, you are requested to go through a few of the articles for beginners to familiarise yourself with App Inventor. Let's proceed to the idea

Figure 2: Creating a new project

behind our application, which will be implementing in this session.

The theme of the application

Most people use smartphones and, on a typical day, use it to browse the Internet, play games, listen to music, watch videos and chat with various people. Have you observed that all your chat records are well maintained, so that you can browse them afterwards as well and can export them via email or to the SD card if you wish? You are already aware of all the components that I will be using for this application — buttons, labels, horizontal arrangement, text box, Firebase DB, etc.

GUI requirements

For every application we have a Graphical User Interface (GUI), which helps the user to interact with the on-screen components. How each component responds to user actions is defined in the block editor section.

The GUI requirements for Screen1 are:

1. **Labels:** Labels are the static text components used to display some headings or markings on the screen.
2. **Button:** A button will let you trigger the event and is a very essential component.
3. **Horizontal arrangement:** These are special components, which keep all child components aligned horizontally within them.
4. **Notifier:** A notifier is used to display some instructions or give you control over your existing components. You will see its functionality in more detail as we implement it in our app.
5. **Firebase DB:** This, as you already
